

DecaFlow — Private Liquidity Layer (Base Native)

DecaFlow is a privacy-first DeFi trading and liquidity protocol built on **Base**, designed for traders who want **MEV protection**, **better execution**, and **cross-chain access** without juggling multiple apps.

What DecaFlow does

- **Privacy swaps / MEV protection:** intent-style execution and private routing to reduce sandwich attacks and front-running.
- **DLMM liquidity pools:** denser liquidity for improved capital efficiency and stronger LP fee capture.
- **Cross-chain swaps & bridging:** secure rails across major chains (with smart routing for best routes and cost).

Why it matters

DeFi is transparent by default. That makes large and small trades easy to exploit. DecaFlow focuses on **quiet execution**, **lower slippage**, and a **clean user experience** for multi-chain traders.
